SECTION 1 - HARDWARE MANUAL

Contents

Rev 2.3 17 July 1981

1.1 Introduction

The Nascom 2 is an exceptionally flexible computer system, and can be set up to operate in a number of different ways. However, in order to ensure correct operation, it is important that the correct switch and wire link options are present to suit the user's application. Those who have bought their board ready-assembled should have had these options set by the supplier, and therefore need not dwell on this section initially. Those who have bought a kit, or who are planning changes to the hardware configuration of their system will find in this section details of how to select the mode of operation which they require.

The flexibility of the system means that there are a number of choices to be made. We recommend that you should read through the instructions which follow twice before proceeding with the configuration process, and that you should proceed through the steps methodically.

Please note particularly the following warnings:

1. Any error in matching the wiring of linkblocks 1-9 with the type of integrated circuit inserted in the associated socket will cause malfunction, and may cause damage.
2. Any incorrect external connection may cause both internal and external damage.

****

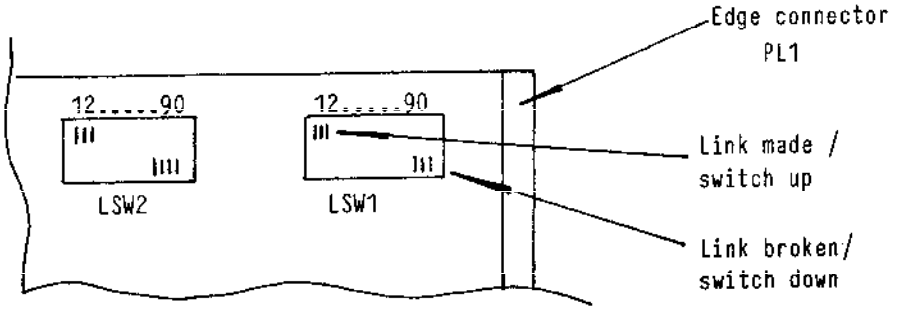
3. ***** **MOST IMPORTANT** *****

The keyboard must be connected ONLY to PL3,and **UNDER NO CIRCUMSTANCES** to PL2, which carries voltages capable of destroying the keyboard.

****

1.2 Links/switches LSW1 and LSW2

Two areas on the extreme edge of the Nascom board contain links or switches which are used to select various run options for the computer. Either wire links or switches may be provided. The locations of these links or switches are shown below:



Note that where the user intends to change any of these links frequently it will be more convenient to take wires from the appropriate link pads to a front-panel switch (eg if baud rate for printers is to be changed frequently).

The functions of these switches can be summarised as follows:

Link/switch	Function	Link made /switch up	Link broken /switch down
LSW1/0	Memory wait	On	Off
LSW1/9	CPU clock select	Internal	Bus
LSW1/8	4K/8K Memory decode	8K	4K
LSW1/7	4K/8K Memory decode	8K	4K
LSW1/6	50/60Hz (625/525 ln)	50Hz/625line	60Hz/525 line
LSW1/5	Stop bits	1	2
LSW1/4	Restart address A15	0	1
LSW1/3	Restart address A14	0	1
LSW1/2	Restart address A13	0	1
LSW1/1	Restart address A12	0	1

Link/switch	Function	Link made /switch up	link broken /switch down
LSW2/0	CPU clock frequency	4 MHz	2 MHz
LSW2/9	Alpha/graphics select	Auto	Alpha only
LSW2/8	Port addressing	External	Internal
LSW2/7	Serial input device	Terminal	Cassette
LSW2/6	Receive speed	Extnl clock	TTY 110 baud
LSW2/5	Receive speed	Use LSW2/6	Use LSW2/4(cassette)
LSW2/4	Cassette receive speed	1200 baud	300 baud
LSW2/3	Transmit speed	Extnl clock	TTY 110 baud
LSW2/2	Transmit speed	Use LSW2/3	Use LSW2/1(cassette)
LSW2/1	Cassette transmit speed	1200 baud	300 baud

Link/switch functions
---

1. LSW1/1 to LSW1/4 select the restart address to which the computer will jump when power is applied or the reset button is pushed. Normally the links are all made (switches up) so that restart occurs in NAS-SYS. If, for example, the links LSW1/4, LSW1/3 and LSW1/2 were not made (switches down) and link LSW1/1 were made then on power-on or manual reset the computer would start up in BASIC, performing a cold start.

2. LSW1/5 selects the number of stop bits, whichseparate characters sent by the serial output interface. Normally only one stop bit will be required, except at 110 baud.

3. LSW1/6 permits selection between TV receivers operating on 50 Hz (625 lines) or 60 Hz (525 lines).

4. LSW1/7 and LSW1/8 allow the on-board memory in sockets 35 to 42 to be treated as one 8K, continuous block, or as 2 independent, 4K blocks. See also notes on the header plug, (section 1.3).

5. LSW1/9 allows for selection between the on-board processor clock (normal state) or a clock on the NAS-BUS.

6. LSW1/0 allows an additional 'wait' state to be used with certain slower memory devices. It may be necessary to turn memory wait on when running BASIC at 4MHz.

7. LSW2/1 to LSW2/3 allow the switching of the serial input rate for a cassette or terminal. LSW2/2 selects whether the rate is to be set by LSW2/1 or LSW2/3. If LSW2/1 is selected, then LSW2/1 determines whether 1200, or 300 baud will be used. If LSW2/3 is selected, then LSW2/3 determines whether the standard 110 baud Teletype rate, or an external clock is to be used to control the speed of data transfer.

8. LSW2/4 to LSW2/6 perform similar functions for the receive data rate.

9. LSW2/7 selects whether the source of serial input is the cassette unit or a terminal.

10. LSW2/8 selects whether any external input/output ports are to be addressed. For a Nascom 2 in isolation only internal ports should be specified.

11. LSW2/9 selects whether the graphic characters can be used. If the graphics generator chip is not present the alpha only mode should be used.

12. LSW2/0 selects between a 4MHz and 2MHz clock speed for the microprocessor. Normally a 4MHz clock will be used.

The normal configuration for the switches when using a 4MHz clock, 1200 baud cassette tape and an 8k memory block is:

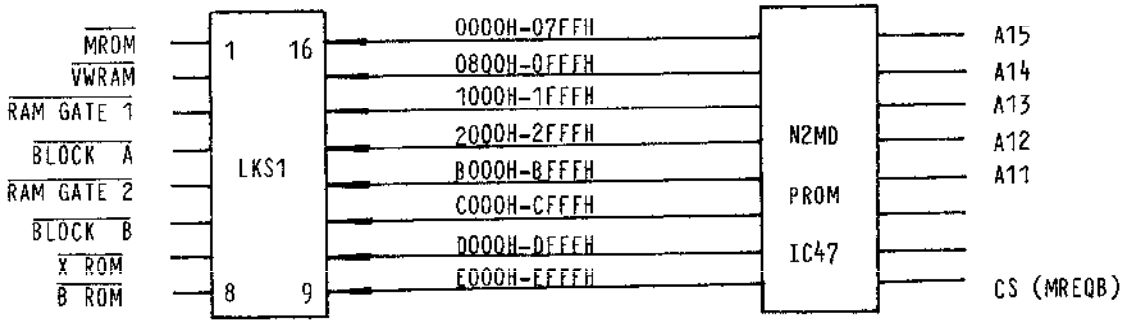
LSW1 1,2,3,4,5,6,7,8,9 link made (switch up)
0 link open (switch down)

LSW2 0,1,4 link made (switch up)
2,3,5,6,7,8,9 link open (switch down)

1.3 LKS1 Header plug

It is recommended when altering the wiring of this header that it should be left plugged into its socket during soldering. This avoids pins becoming displaced as a result of heating.

The header determines the address and type of the on-board memory contained in sockets 35 - 42 and 48. The functions of the connections on the pins are as follows:



1. Pin 1, MROM determines the address of the monitor ROM , IC34. It will normally be connected therefore to pin 16 of the header.

2. Pin 2 determines the address of the video and work area chips on the Nascom board, IC's 50 and 48 respectively. It will normally therefore be connected to pin 15 on the header.

3. Pin 8 determines the address to be used for IC43, the BASIC ROM. It is therefore connected normally to pin 9.

4. Pins 3 and 5 are used in conjunction with either pin 4 or pin 6 to allow read/write memory, RAM, to be used in the positions IC35 - 42.

5. Pin 4 determines the address of one of the 4K memory blocks A or B located in IC35-42. Pin 5 fulfills a similar function for the second block of memory. If the two 4 K blocks of memory have been specified as a contiguous block of 8K then both pin 4 and pin 6 are connected to the two appropriate address pins. The logic of the circuitry is such that block A, in IC35 - IC38, will have the even block address (C000 or E000), and block B, IC39 - IC42, will have the odd block address (B000 or D000).

6. Pin 7, XROM is used to enable one of the memory blocks for reading only, and is therefore used when 2708 EPROM's are located in the A block (IC35 - 38) and/or the B block (IC39 - 42).

The normal configuration of the header for a system with monitor and BASIC, but with no on-board memory in IC35 - IC42 would therefore be:

LSW1/7,8 down  (no connection)

If the sockets IC35 - IC42 are being used for 8 K of 2708 EPROM located at C000 to DFFF (such as NAS-DIS and ZEAP) then the A block will have the C000 starting address and the header will be as follows:

LSW1/7,8 up  (linked)

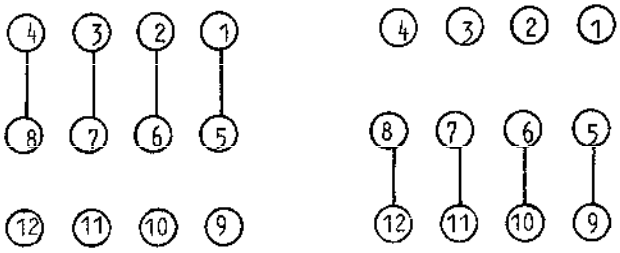
If 4K of 4118 RAM is required at location 1000 with 4K of 2708 EPROM at D000 (using ZEAP, for example) then the header would be as follows:

LSW1/7,8 down  (no connection)

1.4 Memory type linkblocks LK8 1-9

An additional 4 connections must be made for each of IC35 - IC42 and IC48. This is necessary in order to use either 2708 EPROM's or 4118 RAM's in these locations. These connections are made at the linkblocks 1-9. If terminal blocks are fitted it will be found most convenient to wire-wrap these connections, although soldered connections are quite satisfactory.

IC's 35 - 42 can be either 2708 EPROM's or 4118 RAM chips. The centre row of pins contains a common line which is either connected to the row nearer the centre, for 4118 RAM chips, or to the row nearer the edge of the board for 2708 EPROM chips, as shown below.



The actual functions performed by the individual connections are as follows:

Link block	Socket pin	RAM	EPROM	4118	2708
5 pin	21	WRB	-5V	WE	Vbb (-5V)
6	20	RDB	CS	OE	CS/WE
7	19	+5V	+12V	I	Vdd (+12V)
8	18	CS	0V	CS	PROGRAM

By selecting combinations of connections, it is possible to use certain other types of memory components.

The linkblock LKB9 for IC48 must also be linked in this way, but in this case the chip used is normally a 4118 for workspace RAM, and the block should be wired accordingly.

1.5 Memory addressing

The Nascom 2 has been designed to allow complete flexibility in the use of different forms of memory - RAM, EPROM and ROM. However in the normal non-disc system the following allocation of memory on the main board is used:

0000 - 07FF NAS-SYS monitor program

0800 - 0BFF Video display memory

0C00 - 0FFF Workspace, used by various standard programs

E000 - FFFF BASIC ROM

The remaining memory in locations 1000 to DFFF (52 K bytes) is available to the user. However, in order to avoid potential clashes in utility programs which may be developed in the future, it is suggested that the following areas should be reserved for the purposes indicated:

1000 - 8FFF General RAM space for user programs

9000 - 9FFF Programmable graphics RAM or general RAM space

9800 - AFFF Colour graphics RAM or general RAM space

B000 - B7FF Extensions to the operating system and/or NASPEN

B800 - BFFF NASPEN or other word processing

C000 - CFFF NAS-DIS or other disassembler/debug programs or colour graphics control software

D000 - DFFF ZEAP or other assembler type software

It should be emphasised that these are only recommendations, and it cannot be guaranteed that some alterations to these assignments may be required as a result of future developments.

1.6 Video memory addressing

The video screen display is stored in memory locations 0800 to 0BFF, and this may be accessed directly from programs to output or input data. This memory is organised as shown:

Margin	Start display line ...	... end of line	Margin
0BC0(3008)	0BCA(3018).....	.....0BF9(3065)	0BFF(3071)
0800(2048)	080A(2058).....	.....0839(2105)	083F(2111)
0840(2112)	084A(2122).....	.....0879(2169)	087F(2175)
0880(2176)	088A(2186).....	.....08B9(2233)	08BF(2239)
08C0(2240)	08CA(2250).....	.....08F9(2297)	08FF(2303)
0900(2304)	090A(2314).....	.....0939(2361)	093F(2367)
0940(2368)	097F(2378).....	.....0979(2425)	097F(2431)
0980(2432)	098A(2442).....	.....09B9(2489)	09BF(2495)
09C0(2496)	09CA(2506).....	.....09F9(2553)	09FF(2559)
0A00(2560)	0A0A(2570).....	.....0A39(2617)	0A3F(2623)
0A40(2624)	0A4A(2634).....	.....0A79(2681)	0A7F(2687)
0A80(2688)	0A8A(2698).....	.....0AB9(2745)	0ABF(2751)
0AC0(2752)	0ACA(2762).....	.....0AF9(2809)	0AFF(2815)
0B00(2816)	0B0A(2826).....	.....0B39(2873)	0B3F(2879)
0B40(2880)	0B4A(2890).....	.....0B79(2937)	0B7F(2943)
0B80(2944)	0B89(2954).....	.....0BB9(3001)	0BBF(3007)

NOTE:-

The margin area is not displayed, and as the monitor affects these locations they should not be used.

The top line of the display is protected from scrolling, so that titles can be maintained on the screen. It can, however, be cleared using a 'clear screen' (CS, shift/backspace) or by a reset of the computer.

1.7 Input/output port addressing

The subject of input and output is described in more detail in the input/output section of this manual (section 6). The allocation of input and output addresses used on the Nascom 2 board itself is as follows:

PORT	Output Bit	Input bit
P0	7 Not available	7 Unused
	6 Not used	6 Keyboard S6
	5 Unused	5 Keyboard S3
	4 Tape drive LED	4 Keyboard S5
	3 Single step	3 Keyboard S4
	2 Unused	2 Keyboard S0
	1 Reset keyb'd count	1 Keyboard S2
	0 Clock keyb'd count	0 Keyboard S1
P1	0 - 7 Data to UART (Serial port)	0 - 7 Data from UART (Serial port)
P2	0 - 7 Not assigned	7 Data received from UART
		6 UART TBR empty
		5 Not assigned
		4 Not assigned
		3 F error on UART
		2 P error on UART
		1 O error on UART
		0 Not assigned

PORT	Used for	
P3	Not assigned	Not assigned
P4	PIO port A data input and output	
P5	PIO port B data input and output	
P6	PIO port A control	
P7	PIO port B control	

The PIO, IC19, although physically one component, contains two almost identical input/output ports, which are referred to as 'port A' and 'port B' of the PIO. They are assigned separate absolute addresses for access by the computer as shown above.

The remaining ports (P8 to PFF) can be used on expansion boards. If they are not present the link/switch LSW2/8 should be set for INTERNAL operation. If the ports are used, then it must be set to external.

1.8 Power supply requirements and connections

The power supply requirements for a Nascom 2 board are as follows:

Voltage	Current	Connected to
+5 V	2 Amps max (typically 1.5 Amps)	TP 17
+12 V	250 mA max	TP 16
-5 V	250 mA max	TP 14
-12 V	25 mA (for RS232 interface only)	TP 15
0 V		TP 13

Note:

1. These requirements are for the Nascom 2 board only, without expansion boards.

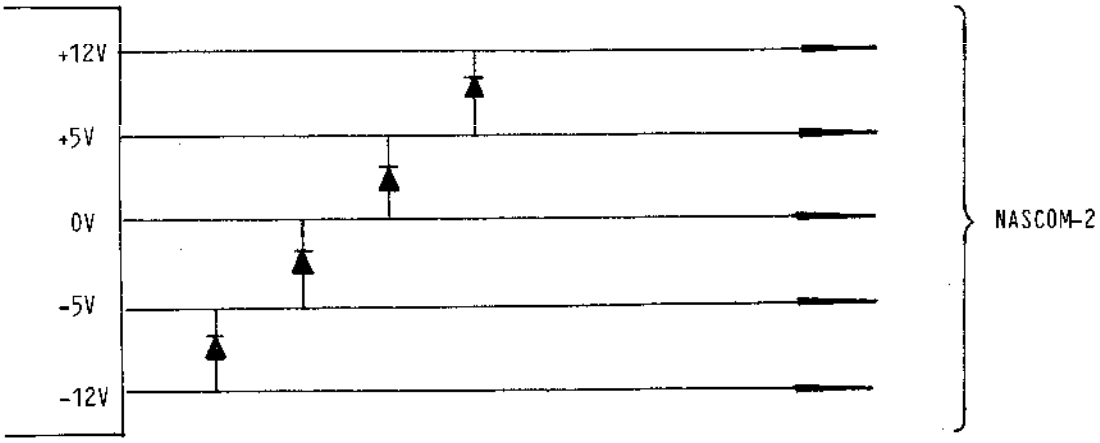
2. If the wires connecting the power supply unit to the CPU board are over 18 inches (45 cm) long, additional electrolytic decoupling capacitors should be fitted to all the supply lines on the CPU board.

3. Thick wires must be used for +5 V and 0 V to avoid voltage drops.

4. All supply voltages on the CPU board must be accurate to +/- 5%.

5. The Nascom 3 Amp power supply unit is available and is suitable for driving a Nascom 2 with at least 2 RAM boards. It provides +12 Volts at 1 Amp, +5 Volts at 3 Amps, -5 Volts at 0.5 Amps and -12 Volts at 0.5 Amps.

6. If a power supply which does not have voltage crossover protection is to be used then diodes should be connected as shown on the next page - the 1N4001 is a suitable type to use. (The Nascom 3 Amp supply incorporates this protection already).



1.9 Tuning the TV

The output from the modulator should be connected to the aerial socket of the TV. The power should then be turned on, and the TV tuned through the UHF band until the computer output becomes visible. There will be several points at which it is possible to obtain a picture.

1.10 Cassette interface adjustment

The cassette interface is switchable to speeds of either 300 baud or 1200 baud. For speed of operation the 1200 baud rate is recommended - the main reasons for the 300 baud rate are for replay of tapes recorded at this rate and for operation with serial printers operating at 30 characters per second. It is also possible to use the cassette unit at 2400 baud, by linking TP4 to TP20 (transmit) and TP21 to TP5 (receive). Link/switches LSW2/2 and LSW2/3 should be in the upper position when using this 2400 baud option for transmitting, and link/switches LSW2/5 and LSW2/6 should be up for receiving at 2400 baud.

Connections between the cassette unit and computer should be made using screened cable. Two different output levels have been provided from the computer to the recorder - high, which provides 500 mV and low which provides 50 mV. On most recorders, it is preferable to use the microphone input and headphone/monitor/external speaker connection. It is also noted that some recorders produce better results when the high output from the computer is connected to the microphone input, even though this might not appear to be what one would expect.

The connections required are as follows:

Cassette output to Nascom - link to TP9 or PL2 pin 16.

Nascom output to cassette unit -
Connect to TP7 or PL2 pin 14 for low output.
Connect to TP6 or PL2 pin 13 for high output.

The common (earth) connections should be linked to TP8 or PL2 pin 15 or PL2 pin 11 using the screen of the interconnecting cable.

To obtain optimum results from the tape recorder interface, it is necessary to adjust the potentiometer VR1. This can be done in two ways, depending on the availability of a multimeter.

1. Without a meter

Set VR1 to mid range. This can be done by turning the adjusting screw 15 turns anti-clockwise, followed by 5 turns clockwise (since it is a 10 turn potentiometer).

Copy a single character into a block of memory using the M and C commands of NAS-SYS.

Enter X mode.

Dump data onto cassette for about 5 minutes at 300 baud, using the T command from NAS-SYS.

Rewind the cassette. Set volume and tone controls to mid range.

Replay the data into memory using the L or V commands.

The incoming data will be written across the bottom line of the screen, and if it has not been corrupted, it will then disappear. Any errors will cause the lines concerned to be scrolled up the screen.

The cassette replay volume should now be adjusted to find the levels between which it can be set without data corruption. If there are problems, then the setting of VR1 should be altered by one turn and the procedure repeated.

Finally the whole procedure should be carried out at 1200 baud to confirm correct operation at that speed.

2. Use of a multimeter

Adjusting the cassette interface can be carried out more easily if a multimeter is available using the following procedure:

Temporarily connect TP6 to TP9.

Type R <ENTER> from NAS-SYS

Adjust VR1, so that the voltage reading on the meter is the same between TP19 and 0 Volts as between TP19 and +5 Volts. This has the effect of achieving an equal mark/space ratio on the signal.

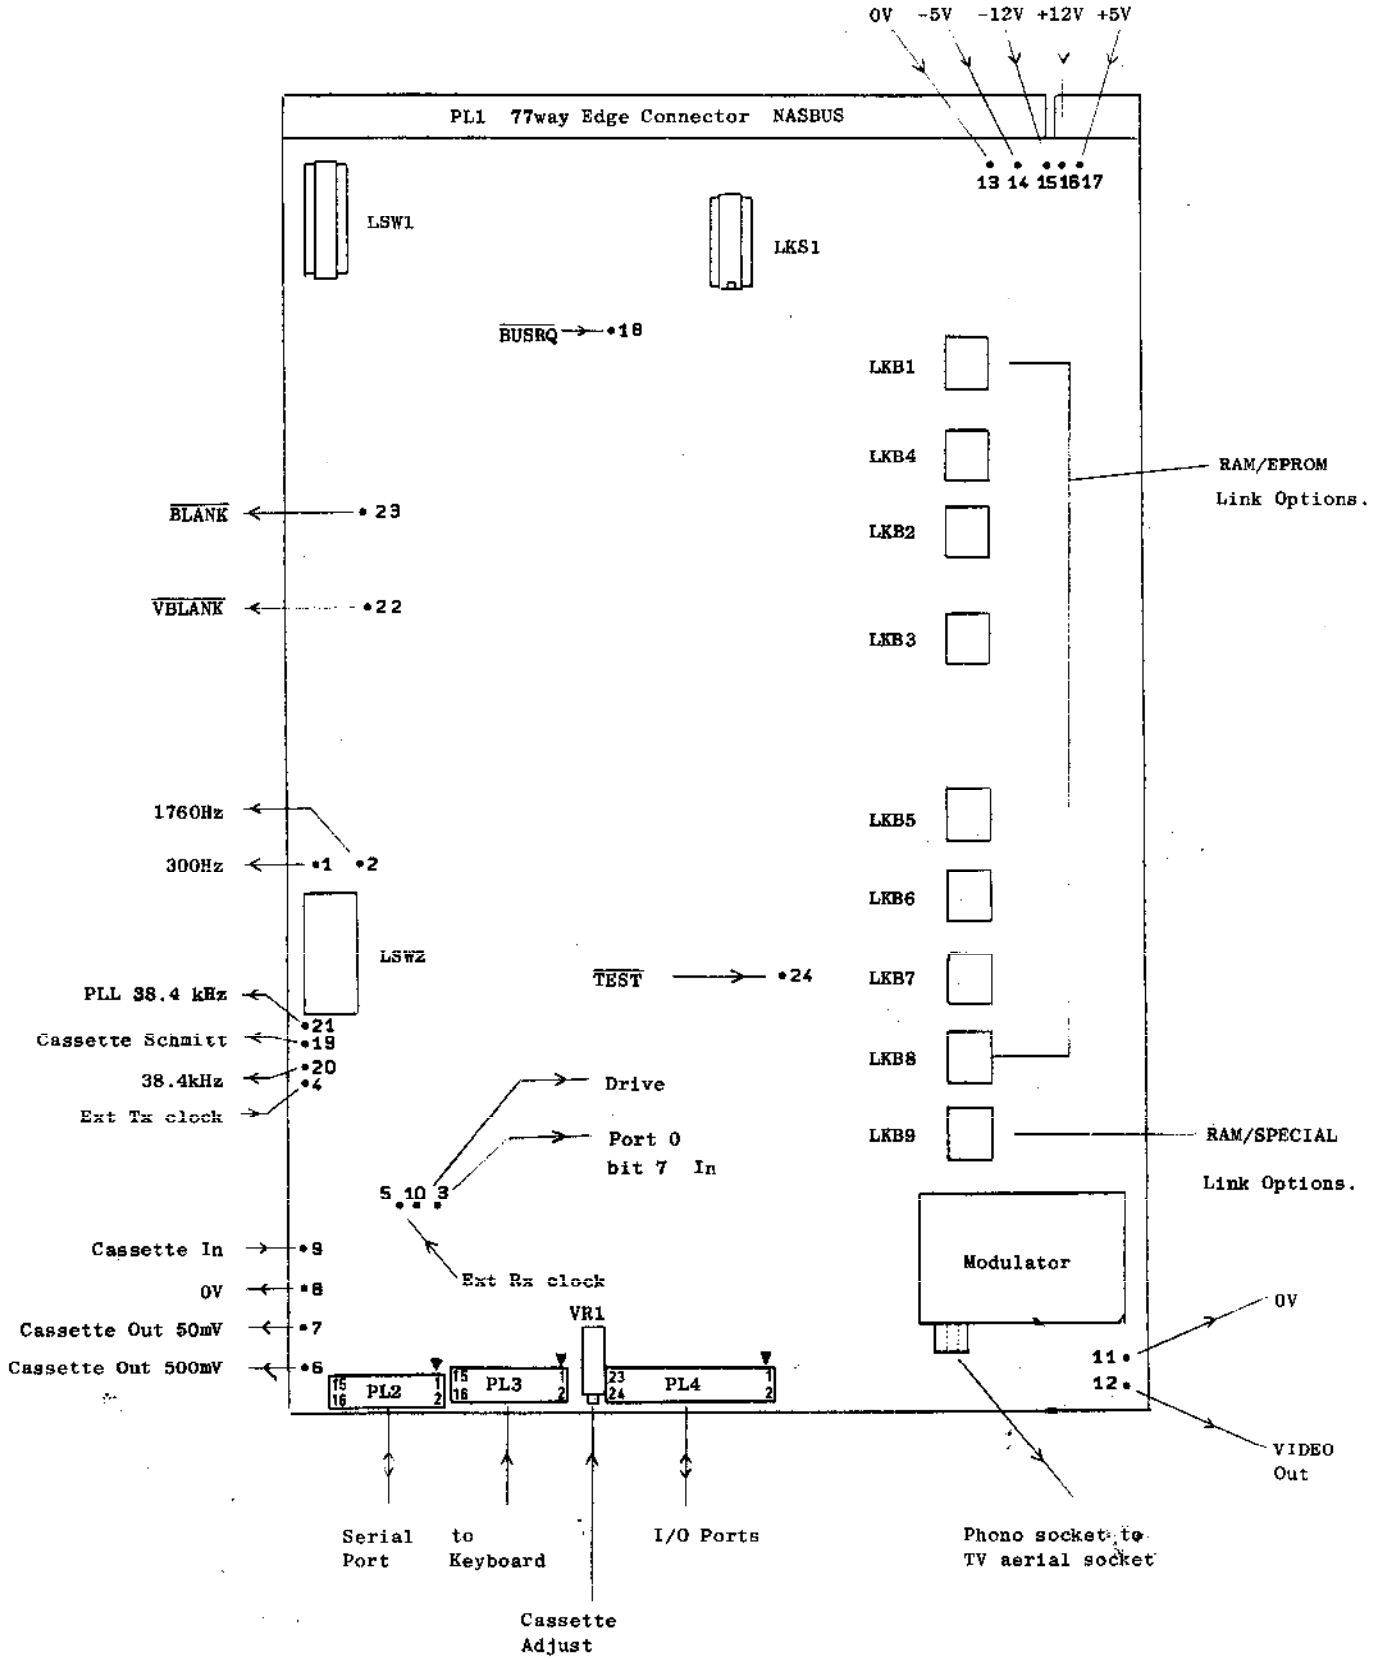
Following this set-up procedure the correct operation of the computer can be confirmed by the 'ring around' test. Leave TP6 and TP9 connected and execute the NAS-SYS command, X0. It should now be possible to type one or two characters and see these automatically loop round echoing from output to input indefinitely. This test can always be used to confirm that the interface is fully operational.

Following these tests remember to disconnect TP6 from TP9!

Acknowledgements

We would like to acknowledge the valuable suggestions made by many Nascom users and dealers which have been incorporated in this manual.

1.11 External Connections



1.12 External Socket Assignments

The four main interconnection sockets are assigned as follows:-

PL1 refer to NASBUS functional specification

PL2 (SERIAL)

1	DRIVE	9	20mA LOOP IN
2	+5V	10	+12V
3	RS232 IN	11	GND
4	EXT TX CLOCK	12	20mA LOOP OUT
5	EXT RX CLOCK	13	CASS. OUT HI
6	RS232 OUT	14	CASS. OUT LO
7	-12V	15	GND
8	spare	16	CASS IN

PL3 (KEYBOARD)

1	DØ	9	D4
2	+5V	10	$\overline{\text{RESET SWITCH}}$
3	D1	11	D5
4	$\overline{\text{NMLSW}}$	12	IC24/2(QØ)
5	D2	13	D6
6	IC24/15 (Q5)	14	IC24/5 (Q1)
7	D3	15	D7
8	IC24/7 (Q2)	16	GND

PL4

1	B5	14	NC
2	B4	15	A1
3	B6	16	GND
4	B3	17	A2
5	B7	18	GND
6	B2	19	A3
7	ARDY	20	+5V
8	B1	21	A4
9	$\overline{\text{BSTB}}$	22	+5V
10	BØ	23	A5
11	$\overline{\text{ASTB}}$	24	A7
12	BRDY	25	A6
13	AØ	26	NC

IMPORTANT

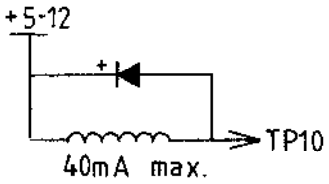
PL2 CARRIES ±12V RAILS ; THE KEYBOARD MAY BE SERIOUSLY DAMAGED IF IT IS CONNECTED TO PL2.

1.13 Test Points

POINT	PARAMETER	CCT. DIAGRAM SHEET
TP1	300Hz from IC31/3	2
TP2	1760 Hz from IC21/1 (see note (1))	2
TP3	Keyboard port Ø bit 7	2
TP4	Ext TX clock input	2
TP5	Ext Rx clock input	2
TP6	Cassette 500mV (HI) output	2
TP7	Cassette 50 mV (LO) output	2
TP8	Ov for cassette 1/0	2
TP9	Cassette Input	2
TP10	Cassette Drive (see note (2))	2
TP11	Ov for video	4
TP12	video output signal	4
TP13	Ov	
TP14	-5V	
TP15	-12V PSU inputs	
TP16	+12V	
TP17	+5V	
TP18	BUSRQ (Bus Request) NASBUS line 18	1

(1) Actual Frequency 1748Hz

(2) May be used to drive a relay:



TP19	Cassette Schmitt output (Input signal after squaring)	2
TP20	38.4KHz (IC22/1)	2
TP21	38.4KHz from PLL (IC23/IC306)	2
TP22	$\overline{\text{VBLANK}}$ Vertical blanking signal from IC59/2	4
TP23	$\overline{\text{BLANKING}}$ Combined blanking signal from IC8/3	4
TP24	$\overline{\text{BAO}}$ / $\overline{\text{TEST}}$ from NASBUS line 16	1

KEYBOARD

NO. USED	CIRCUIT REF.	DESCRIPTION	OBTAINED CHECK
1	KBD	Built and tested solid state keyboard with 57 keys and associated circuit on PCB.	( )
1		Switch to be added to above.	( )
1		Keytop marked 'RS' or 'Reset' for Reset function	( )
MISCELLANEOUS			
1		12" x 8" Double sided PCB with through hole plating and solder resist on both sides, yellow silk screen legend on the component side and a gold plated edge connector on the other side.	( )
1		16 MHz Xtal	( )
27	LKB.1-4	4 pin plugs for Linkblocks	( )
2	PL 2,3	16 pin plugs	( )
1	PL 4	24 pin plug	( )
1	LSW 1 *	DIL 10 way SPST Switch	( )
1	LSW 2 *	TIL 10 way SPDT Switch	( )
1	MD1	ASTEC UHF Modulator UM1111E36 (or type UM1231 for France)	( )
1		16 way double ended ribbon cable assy for PL3-KBD	( )
1		16 way single ended ribbon cable assy for PL2	( )
1		26 way single ended ribbon cable assy for PL4	( )
24	TP1-24	Solder pins push fit in 1 mm dia.hole (for video, cassette connections etc.)	( )
1		Phono Plug	( )
1		Belling Lee Co-ax Plug (for TV)	( )
2 metres		Co-ax Cable to TV set aerial skt.	( )
10 metres		22 Gauge Solder	( )

* These switches may be omitted from kits, in which case wire links are used in their place as detailed in the manual.
